$$OTA: Z = \frac{0}{g_T}$$

$$OPV: Z = RC$$

$$U_c = \frac{1}{j\omega C} I_1, i = \frac{dU_c}{dt} = C \frac{dU_c}{dt} \Rightarrow I_1 = C \cdot s U_c$$

$$U_c = \frac{-g_T U_1}{sC}, I_1 = -g_T U_c$$

$$\Rightarrow Z_1 = \frac{U_1}{I_1} = \frac{sC}{-g_T} = -s \cdot \frac{C}{g_T}$$

$$\text{双极型 } I_a = I_s \exp\left(\frac{U_e}{U_T}\right) \quad g_T = \frac{I_a A}{U_T}$$

MOS: 可变电阻

$$I_D = \frac{\beta}{2} (U_{GS} - U_{th})^2 (1 + \lambda U_{DS}), \text{ 厄利效应可忽略}$$

$$g_T = \sqrt{2\beta I_{DA} (1 + \lambda U_{DSA})} \approx \sqrt{2\beta I_{DA}} = g_m$$

恒流源

$$I_a = I_D = \beta \left[(U_e - U_{th}) U_{DS} - \frac{U_{DS}^2}{2} \right]$$

$$g_T = g_m = \beta \cdot U_{DSA}$$

5.4 Schaltungsprinzipien

5.4.1 差分电路

$$I_a = I_1 - I_2 = I_0 \tanh \frac{U_e - I_a \frac{R_E}{2}}{2U_T}, \text{ 当无 } R_E \text{ 时 } g_T = \frac{\partial I_0}{\partial U_e} \Big|_{U_e=0} = \frac{I_0}{2U_T} = \frac{I_C}{U_T}$$

$$\text{求导: } F(I_a, U_a) = I_0 \tanh \frac{U_e - I_a \frac{R_E}{2}}{2U_T} - I_a = 0$$

泰勒级数: $\tanh x \sim x$

$$I_0 \cdot \frac{1}{2U_T} \cdot (U_e - I_a \frac{R_E}{2}) - I_a = 0$$

$$\frac{I_0}{2U_T} dU_e - \left(\frac{I_0 R_E}{4U_T} \right) dI_a = 0 \Rightarrow \frac{dI_a}{dU_e} = \frac{I_0}{2U_T} \cdot \frac{4U_T}{I_0 R_E + 4U_T} = \frac{1}{2} \frac{2I_0}{I_0 R_E + 4U_T} = \frac{g_T}{1 + g_T \frac{R_E}{2}}$$

由 $\frac{A}{1 + AF}$ 得: $AF = g_T \cdot \frac{R_E}{2}$, 闭环增益

$$I_a = a_1 U_e + a_2 U_e^2 + a_3 U_e^3, \Rightarrow \begin{cases} a_1 = g_T / (1 + g_T \frac{R_E}{2}) \\ a_2 = 0 \\ a_3 = -\frac{g_T'}{12U_T^2} (1 - \frac{R_E}{2} g_T')^3, \text{ } g_T' \text{ 即为 } a_1 \end{cases}$$

$$\textcircled{1} HP_3 = \frac{1}{4} \left| \frac{a_3}{a_1} \right| U_e^2 \approx \frac{1}{48} \left(\frac{1}{1 + R_E \cdot \frac{g_T}{2}} \right)^3 \left(\frac{U_e}{U_T} \right)^2, \text{ 闭环(有反馈)}$$

$$\textcircled{2} HP_3 = \frac{1}{48} \left(\frac{U_e}{U_T} \right)^2, \text{ 开环(无反馈)}$$

$$\text{从 } \textcircled{1} \text{ 式: } R_E = \frac{2}{g_T} \left[\frac{1}{\sqrt{48 HP_3}} \left(\frac{U_e}{U_T} \right)^2 \right] \quad \left(\frac{1}{1 + R_E \cdot \frac{g_T}{2}} \right) = (1 - R_E \cdot g_T')$$

从中解得 I_0 ，我们通常先求出 $\mu_n \cdot g_T'$ ，这样

$$PE = g_T' = 2 \left[1 - \sqrt{48 \cdot HD_3 \cdot \left(\frac{U_e}{U_T} \right)^2} \right], \text{ 或者说从 } HD_3 \text{ 的式子解出更快捷}$$

$$\text{由 } 1 + g_T \cdot \frac{PE}{2} = \frac{g_T}{g_T'} \Rightarrow g_T' + g_T \cdot \frac{1}{2} PE \cdot g_T' = g_T. \quad 1 + \frac{PE}{2} \cdot g_T = \frac{I_0}{2U_T g_T'}$$

$$\Rightarrow I_0 = 2U_T \cdot g_T' (48 HD_3)^{\frac{1}{3}} \left(\frac{U_e}{U_T} \right)^{\frac{2}{3}}$$

4.2. CMOS 差分放大器

先打符号一下。 $I_a = I_{a+} - I_{a-}$

$$U_e = U_{gs1} - U_{gs2}, \quad I_a = \frac{\beta}{2} (U_{gs1} - U_{th})^2 \Rightarrow U_{gs1} = \sqrt{\frac{2\beta}{I_{a1}}} + U_{th}$$

$$= \sqrt{\frac{2\beta}{I_{a1}}} - \sqrt{\frac{2\beta}{I_{a2}}} = \frac{\frac{2\beta}{I_{a1}} - \frac{2\beta}{I_{a2}}}{\sqrt{\frac{2\beta}{I_{a1}} + \sqrt{\frac{2\beta}{I_{a2}}}}} = \frac{2\beta(I_{a2} - I_{a1})}{I_{a1} \cdot I_{a2} \cdot \sqrt{\frac{1}{I_{a1}} + \frac{1}{I_{a2}}}} = \frac{\sqrt{2\beta} (I_{a2} - I_{a1})}{\sqrt{I_{a1} \cdot I_{a2} + I_{a1} I_{a2}}}$$

$$I_{a1} + I_{a2} = I_0.$$

$$\Rightarrow I_{a1} = I_{a1} + I_{a2} =$$

$$I_{a2} - I_{a1} = \frac{1}{\sqrt{2\beta}} \cdot U_e \cdot \sqrt{I_{a1} I_{a2}} (I_{a1} + I_{a2})$$

$$= I_{a2} - I_{a1} = \frac{I_0}{\sqrt{2\beta}} \cdot U_e \cdot \frac{\beta}{2} \cdot [U_{gs1} - U_{th}] [U_{gs2} - U_{th}]$$

当时没解出来。
结果下方

$$\Rightarrow \sqrt{\beta I_0} \cdot U_e \cdot \sqrt{1 - \frac{\beta}{4I_0} U_e^2}, \quad U_{eA} = 0. \quad I_{aA} = 0.$$

$$I_a = a_1 U_e + a_2 U_e^2 + a_3 U_e^3$$

$$\rightarrow a_1 = g_T = \sqrt{\beta I_0}$$

$$a_2 = 0$$

$$a_3 = -\frac{1}{8} \frac{\beta^{\frac{3}{2}}}{\sqrt{I_0}}$$

$$HD_3 = \frac{1}{4} \left| \frac{a_3}{a_1} \right| U_e^2 = \frac{1}{32} \frac{\beta}{I_0} U_e^2, \quad g_T = \sqrt{\beta I_0}$$

$$I_0 = g_T \cdot U_e \sqrt{\frac{1}{32 HD_3}}, \quad \beta = \frac{g_T^2}{U_e^2} \sqrt{32 HD_3}$$

TK-03 电路说明. 可参见 Einstellungscharakteristik 公共极设置. 在 MOS

负载中, 放大倍数 $\approx -\frac{g_{m1}}{g_{m2}} = \frac{\sqrt{\mu_1 \mu_2 (V_{GS1} - V_{th1})}}{\sqrt{\mu_2 (V_{GS2} - V_{th2})}}$, 若扩大增益, 则 $(V_{GS1} - V_{th1})$ 应减小. 而 g_{m2} 又随 V_{GS2} 平均下降. 过驱动电压 $|V_{GS1} - V_{th1}|$ 会增大. 而在两侧并联使用 I_0 后, 减小了第二级 MOS 管的电流. 从而在不改变长宽比的情况下, 降低了 g_{m2} . 例如 $n=0.4$ 时 $\rightarrow I_{T2} = \frac{1}{5} I_{T0} \rightarrow g_{m2} = \frac{1}{5} g_{m20}$. $V \uparrow$ (5x)
