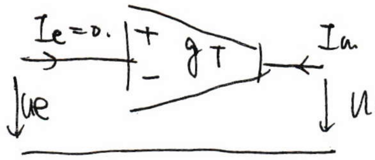
5. Transkonduktionsverstärker

5.1 Modell

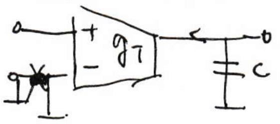


$I_a = g_T U_e$

- 非线性
- I_a, I_e 有限
- 受频率影响

5.2 应用

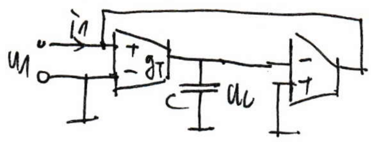
"GmC" Filter



OTA: $\tau = \frac{C}{g_T}$

OPV: $\tau = RC$

"回转器"



$U_c = \frac{1}{j\omega C} \cdot I_1$, $i = \frac{dQ}{dt} = \frac{C\,du}{dt} \Rightarrow I_1 = C \cdot s\, U_c$

$U_c = \frac{-g_T U_1}{sC}$ $\quad I_1 = -g_T U_c$

$\Rightarrow Z_1 = U_1 / I_1 = \frac{sC}{(-g_T)(+g_T)} = s \cdot \frac{C}{g_T^2}$

用容器件变成电感

5.3 Transistor als Elementar

双极管 $I_a = I_s \exp\left(\frac{U_e}{U_T}\right)$ $\qquad g_T = \frac{I_{aA}}{U_T}$

MOS. 可变阻区.

$$I_D = \frac{\beta}{2}(U_{GS} - U_{th})^2 (1 + \lambda U_{DS}), \text{厄尔效应可以忽略}$$

$$g_T = \sqrt{2\beta \cdot I_{DA}(1 + \lambda U_{DSA})} \approx \sqrt{2\beta I_{DA}} = g_m$$

恒流区

$$I_a = I_D = \beta\left[(U_e - U_{th})U_{DS} - \frac{U_{DS}^2}{2}\right]$$

$$g_T = g_m = \beta \cdot U_{DSA}$$

问题(基本放大电路). 1. 非线性 2. T, 工艺 3. 零点漂移

5.4 Schaltungsprinzipien

5.4.1 差分电路

$$I_a = I_1 - I_2 = I_0 \tanh \frac{U_e - I_a \frac{R_E}{2}}{2U_T}$$

, 当无 R_E 时. $g_T = \frac{\partial I_0}{\partial U_e}\Big|_{U_e=0} = \frac{I_0}{2U_T} = \frac{I_C}{U_T}$

求隐导. $F(I_a, U_a) = I_0 \tanh \frac{U_e - I_a \cdot \frac{R_E}{2}}{2U_T} - I_a = 0$.

小信号电化. $\tanh x \sim x$, $\quad I_0 \cdot \frac{1}{2U_T} \cdot \left(U_e - I_a \cdot \frac{R_E}{2}\right) - I_a = 0$

$$\frac{I_0}{2U_T}\,dU_e - \left(\frac{I_0 R_E}{4U_T} + 1\right)dI_a = 0 \Rightarrow \frac{dI_a}{dU_e} = \frac{I_0}{2U_T} \cdot \frac{4U_T}{I_0 R_E + 4U_T} = \frac{2I_0}{I_0 R_E + 4U_T} = \frac{g_T}{1 + g_T \cdot \frac{R_E}{2}}$$

由 $\frac{A}{1+AF}$ 得. $AF = g_T \cdot \frac{R_E}{2}$, 即为环路增益.

$$i_a = a_1 u_e + a_2 u_e^2 + a_3 u_e^3 \Rightarrow \begin{cases} a_1 = g_T / 1 + g_T \cdot \frac{R_E}{2} \\ a_2 = 0 \\ a_3 = -\frac{g_T'}{12 U_T^2}\left(1 - \frac{R_E}{2} g_T'\right)^3 \end{cases}$$

g_T' 即为 a_1.

① $HP_3 = \frac{1}{4}\left|\frac{a_3}{a_1}\right| \hat{u}_e^2 = \frac{1}{48}\left(\frac{1}{1 + R_E \cdot \frac{g_T}{2}}\right)^3 \left(\frac{\hat{u}_e}{U_T}\right)^2$, 闭环(有反馈)

② $HP_3 = \frac{1}{48}\left(\frac{\hat{u}_e}{U_T}\right)^2$, 开环(无反馈)

$$\left(\frac{1}{1 + R_E \cdot \frac{g_T}{2}}\right) = (1 - R_E \cdot g'_T)$$

从①式. $R_E = \frac{2}{g_T'}\left[1 - \sqrt[3]{48(HP_3)\left(\frac{\hat{u}_e}{U_T}\right)^{-2}}\right]$

从中解得 I_0，我们首先推出 $R_E \cdot g_T'$，这样

$$R_E \cdot g_T' = 2\left[1-\sqrt[3]{48 \cdot HD_3 \cdot \left(\frac{\hat{u}_e}{U_T}\right)^2}\right]$$，我就是说从 HD_3 的式子看的更清楚

由 $1+g_T \cdot \frac{R_E}{2} = \frac{g_T}{g_T'}$ $\Rightarrow$ ~~$g_T' + g_T \cdot \frac{1}{2} R_E \cdot g_T' = g_T$~~. $1+\frac{R_E}{2} \cdot g_T = \frac{I_0}{2U_T g_T'}$

$$\Rightarrow I_0 = 2U_T \cdot g_T' \left(48 HD_3\right)^{-\frac{1}{3}} \left(\frac{\hat{u}_e}{U_T}\right)^{\frac{2}{3}}$$

5.4.2. CMOS 跨导放大器

先推导一下. $I_a = I_a^+ - I_a^-$

$U_e = U_{gs1} - U_{gs2}$, $I_a = \frac{\beta}{2}(U_{gs}-U_{th})^2 \Rightarrow U_{gs} = \sqrt{\frac{2\beta}{I_a}} + U_{th}$

$$= \sqrt{\frac{2\beta}{I_{a1}}} - \sqrt{\frac{2\beta}{I_{a2}}} = \frac{\frac{2\beta}{I_{a1}} - \frac{2\beta}{I_{a2}}}{\sqrt{\frac{2\beta}{I_{a1}}}+\sqrt{\frac{2\beta}{I_{a2}}}} = \frac{\frac{2\beta(I_{a2}-I_{a1})}{I_{a1} \cdot I_{a2}}}{\sqrt{2\beta}\left(\frac{1}{\sqrt{I_{a1}}}+\frac{1}{\sqrt{I_{a2}}}\right)} = \frac{\sqrt{2\beta}\,(I_{a2}-I_{a1})}{\left(\sqrt{I_{a1}} \cdot I_{a2} + I_{a1}\sqrt{I_{a2}}\right)}$$

$I_{a1}+I_{a2} = I_0$.

暂时没解出来.
结果下面

$\Rightarrow I_0 = I_{a1} + I_{a2} =$

$$I_{a2} - I_{a1} = \frac{1}{\sqrt{2\beta}} \cdot U_e \cdot \sqrt{I_{a1} I_{a2}}\,(I_{a1}+I_{a2})$$

$$= I_{a2} - I_{a1} = \frac{I_0}{\sqrt{2\beta}} \cdot U_e \cdot \frac{\beta}{2} \cdot [U_{gs1}-U_{th}][U_{gs2}-U_{th}]$$

$$\Rightarrow \sqrt{\beta I_0} \cdot U_e \cdot \sqrt{1-\frac{\beta}{4I_0}U_e^2}$$, $U_{eA}=0$. $I_{aA}=0$.

$I_a = a_1 U_e + a_2 U_e^2 + a_3 U_e^3$

$\rightarrow a_1 = g_T = \sqrt{\beta I_0}$

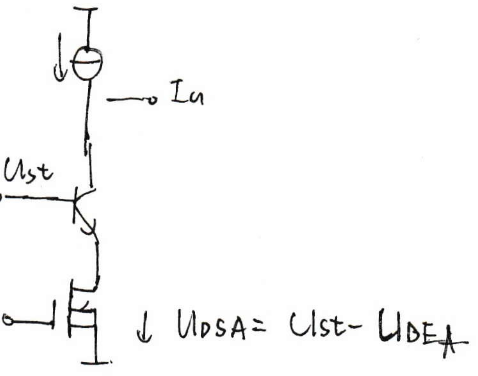
$a_2 = 0$

$a_3 = -\frac{1}{8}\frac{\beta^{\frac{3}{2}}}{\sqrt{I_0}}$

$HD_3 = \frac{1}{4}\left|\frac{a_3}{a_1}\right|\hat{u}_e^2 = \frac{1}{32}\frac{\beta}{I_0}\hat{u}_e^2$, $g_T = \sqrt{\beta_0 I_0}$

$I_0 = g_T \cdot \hat{u}_e \sqrt{\frac{1}{32 HD_3}}$. $\beta = \frac{g_T}{\hat{u}_e}\sqrt{32 HD_3}$

5.4.3. BiCMOS – Transkonduktanzverstärker



$I_D = \beta\left[(U_{GS}-U_{th})U_{DS} - \frac{U_{DS}^2}{2}\right]$

$g_n = \beta U_{DSA}$.
